Requester's Full Name: KRISHNAN MENON Examiner #: 79533 Date: 10/5/03
Art Unit: 1723 Phone Number 30 5-5999 Serial Number: 09/914704
Mail Box and Bldg/Room Location: C33 SC14 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: Sulfonated aromatic polymer, membranes, method of production
Inventors (please provide full names): Alexander Dyck et al

Earliest Priority Filing Date: Aug 31 2000

**For Sequence Searches Only* Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.*

Patent claims

1. A sulfonated aromatic polymer comprising the repeating structural unit of the formula (I)

in which Ar^1 and Ar^2 are, independently of one another, divalent aromatic or heteroaromatic radicals which are optionally substituted by one or more monovalent organic groups which are inert under the conditions of use or sulfonic acid groups, R is hydrogen, an alkali metal or alkaline earth metal ion or an ammonium ion, n is an integer from 0 to 3, m is 0, 1 or 2 and X is a -CO- , -O- , $\text{-C}_p\text{H}_{2p-}$, $\text{-C}_p\text{F}_{2p-}$ or -S- group, in which p is an integer from 1 to 10.

2. A sulfonated aromatic polymer as claimed in claim 1, which, besides the repeating structural unit of the formula I, comprises the repeating structural unit of the formula II

in which Ar^1 , Ar^2 , R, m and n have the meaning defined in claim 1, and Y is a -CO- , -O- , $\text{-C}_p\text{H}_{2p-}$, $\text{-C}_p\text{F}_{2p-}$, -S- or $\text{-SO}_2\text{-}$ group in which p is an integer from 1 to 10.

3. A sulfonated aromatic polymer as claimed in either of claims 1 or 2, wherein X is -CO- .

4. A sulfonated aromatic polymer as claimed in either of claims 1 or 2, wherein Ar^1 and Ar^2 are, independently of one another, phenylene, naphthylene and/or biphenylene, in particular 1,3- and/or 1,4-phenylene.

PRELIMINARY AMENDMENT

Sir:

Prior to fee calculation and examination please amend the above-identified application as follows.

In the Claims

Please cancel claims 3-18.

Please add the following new claims.

- 19. The sulfonated aromatic polymer as claimed in claim 1, wherein X is -CO-.
20. The sulfonated aromatic polymer as claimed in claim 1, wherein Ar¹ and Ar² are, independently of one another, phenylene, naphthylene or biphenylene.
21. The sulfonated aromatic polymer as claimed in claim 1, which further comprises the

#6/A
8-7-02

A'

1999/F 044 (8577*38)

repeating structural unit of the formula III

in which Ar^2 , R , m and n have the meaning defined in claim 1, Z is a $-CO-$, $-O-$, $-C_pH_{2p}-$, $-C_pF_{2p}-$, $-S-$ or $-SO_2-$ group in which p is an integer from 1 to 10, and Ar^3 is a divalent aromatic or heteroaromatic radical which is optionally substituted by one or more monovalent organic groups which are inert under the conditions of use.

22. The sulfonated aromatic polymer as claimed in claim 21, wherein the molar proportion of the repeating structural unit of the formula I is 10-50% and the molar proportion of the repeating structural unit of the formula III is 90-50%.
23. The sulfonated aromatic polymer as claimed in claim 1, which consists essentially of the repeating structural unit of the following formula:

24. The sulfonated polymer as claimed in claim 1, which has an ion exchange capacity of between 0.5 and 3.0 meq $(-SO_3H)/g$ of polymer.
25. A membrane comprising the sulfonated polymer as claimed in claim 1.
26. The membrane as claimed in claim 25, which has a proton conductivity in contact with

1999/F 044 (8577*38)

liquid water, determined by impedance spectroscopy in water at 80°C, of between 120 and 350 mS/cm.

27. The membrane as claimed in claim 25, which comprises as further polymer component a sulfonated, aminated or else underivatized aromatic polymer.
28. The membrane as claimed in claim 25, which has a thickness of between 10 and 150 μm .
29. A method for producing a membrane as claimed in claim 25, comprising the steps of:

- (i) dissolving a sulfonated aromatic polymer comprising the repeating structural unit of the formula (I) or its salt form,

in which Ar^1 and Ar^2 are, independently of one another, divalent aromatic or heteroaromatic radicals which are optionally substituted by one or more monovalent organic groups which are inert under the conditions of use or sulfonic acid groups, R is hydrogen, an alkali metal or alkaline earth metal ion or an ammonium ion, n is an integer from 0 to 3, m is 0, 1 or 2 and X is a $-\text{CO}-$, $-\text{O}-$, $-\text{C}_p\text{H}_{2p}-$, $-\text{C}_p\text{F}_{2p}-$ or $-\text{S}-$ group, in which p is an integer from 1 to 10,

in an aprotic organic solvent,

- (ii) spreading the solution on a support, and
 - (iii) evaporating the solvent to form the membrane.
30. The method for producing a membrane as claimed in claim 29, wherein the solution is DMF, DMAC, NMP or DMSO and said polymer has a concentration being between 3 and 30% by weight.

1999/F 044 (8577*38)

31. The method for producing a membrane as claimed in claim 29, wherein the salt forms of the polymer are employed and wherein the salt forms can be converted into the acid form by treatment with an acid after production of the membrane.
32. The method for producing a membrane as claimed in claim 29, wherein the remaining solvent or salts are removed after the membrane production by a washing medium.
33. The sulfonated aromatic polymer as claimed in claim 2, wherein Ar^1 and Ar^2 are, independently of one another, 1,3-phenylene or 1,4-phenylene.
34. The sulfonated aromatic polymer as claimed in claim 1, wherein Ar^1 and Ar^2 are, independently of one another, 1,3-phenylene or 1,4-phenylene.
35. The sulfonated aromatic polymer as claimed in claim 2, which further comprises the repeating structural unit of the formula III

in which Ar^2 is a divalent aromatic or heteroaromatic radicals which is optionally substituted by one or more monovalent organic groups which are inert under the conditions of use or sulfonic acid groups,

R is hydrogen, an alkali metal or alkaline earth metal ion or an ammonium ion,

n is an integer from 0 to 3,

m is 0, 1 or 2,

Z is a $-CO-$, $-O-$, $-C_pH_{2p}-$, $-C_pF_{2p}-$, $-S-$ or $-SO_2-$ group in which p is an integer from 1 to 10, and Ar^3 is a divalent aromatic or heteroaromatic radical which is optionally substituted by one or more monovalent organic groups which are inert under the conditions of use.

1999/F 044 (8577*38)

36. The sulfonated aromatic polymer as claimed in claim 35, wherein the molar proportion of the repeating structural unit of the formula I and formula II is 10-50% and the molar proportion of the repeating structural unit of the formula III is 90-50%.
37. The sulfonated polymer as claimed in claim 36, which has an ion exchange capacity of between 1.0 and 2.0 meq (-SO₃H)/g of polymer.
38. The membrane as claimed in claim 25, which comprises as further polymer a polyether sulfone, polysulfone, polybenzimidazole or polyether ketone and the membrane has a thickness of between 20 and 60 μ m.
39. The membrane as claimed in claim 31, wherein said salt forms of the polymer are NH₄, Li, Na or K salts.
40. The method as claimed in claim 32, wherein said washing medium is a 5% strength mineral acid in water.
41. A fuel cell which comprises the membrane as claimed in claim 25.
42. The fuel cell as claimed in claim 41, wherein the fuel cell is a direct methanol fuel cell.
43. A high-performance capacitor which comprises the membrane as claimed in claim 25.
44. A dialysis apparatus which comprises the membrane as claimed in claim 25. - -

REMARKS

The applicants respectfully request that the preliminary amendment be entered prior to fee calculation and examination. Support for newly added claims 19-32 can be found in the original claims 3-16 respectively. The applicants have rewritten these claims in the proper US form and

L14 ANSWER 1 OF 7 ZCAPLUS COPYRIGHT 2003 ACS on STN

2003:667504 Document No. 139:181229 Polyimide membrane for gas separation and manufacture of the membrane. Okamoto, Kenichi; Hirano, Tetsuji (Ube Industries, Ltd., Japan). Jpn. Kokai Tokkyo Koho JP 2003236352 A2 20030826, 5 pp. (Japanese). CODEN: JKXXAF. APPLICATION: JP 2002-38617 20020215.

AB The membrane has an arom. polyimide-derived imide backbone and mol.-level pores as a result of removal of substituents from the polyimide, which is used as a mol. sieve for gas sepn. The membrane is manufd. from an arom. polyimide film substituted with groups leaving by thermal decompn. by heating for removal of the groups. Thus, 8:2:10 (mol) 2,2'-benzidinedisulfonic acid Et3N salt-9,9-bis(4-aminophenyl)fluorene-1,4,5,8-naphthalenetetracarboxylic dianhydride copolymer was cast to give a film, which was H-exchanged and heated in N at 450.degree. for 1.5 h to give a film showing CO2 permeability 420 .times. 10-10 cm3(STP)cm/cm2-s-cmHg.

2002 CODEN: ACPPAY. ISSN: 0032-3934. Publisher: American
Chemical Society, Division of Polymer Chemistry.
- AB Our research interests have been focused on the design of new
monomeric and polymeric materials using organoiron complexes as
precursors. Cyclopentadienyliron chloroarene complexes were used to
mediate the synthesis of sulfide contg. compds. These compds. were
designed with various arom. and aliph. spacers. Oxidn. of the
sulfides led to the isolation of the sulfone monomers with terminal
chloro groups. These monomers were also subjected to sulfonation
reactions to give their corresponding sulfonic acid salts in very
good yields. Polycondensation of the monomers with diphenolic
reagents led to the formation of the polysulfones.

L20 ANSWER 1 OF 22 ZCAPLUS COPYRIGHT 2003 ACS on STN
2003:734849 Manufacture of sulfonate group-containing polymers. Ogami,
Koichi; Takasugi, Shingo; Otsuki, Toshitaka (JSR Ltd., Japan). Jpn.
Kokai Tokkyo Koho JP 2003261653 A2 20030919, 10 pp. (Japanese).
CODEN: JKXXAF. APPLICATION: JP 2002-61034 20020306.

AB The polymers for battery electrolytes, displays, sensors,
capacitors, ion exchange **membranes**, etc., are manufd. by
sulfonating polyarylenes with (1) .gtoreq.10 mL (based on 1 g of
polyarylenes) of 95-97.4%-concn. H2SO4 at .gtoreq.20.degree. or (2)
.gtoreq.3 mL (based on 1 g of polyarylenes) of .gtoreq.97.5%-concn.
H2SO4 at .ltoreq.25.degree.. Thus, 2,2-bis(4-hydroxyphenyl)-
1,1,1,3,3,3-hexafluoropropane-4,4'-dichlorobenzophenone copolymer
oligomer was reacted with 2,5-dichloro-4'-(4-
phenoxy)phenoxybenzophenone to give a copolymer, 25 g of which was
reacted with 750 mL of 96.4%-H2SO4 at 25.degree. to give a
sulfonate-contg. polymer having sulfonate equiv. 2.1 mg-equiv/g and
high hot water resistance.

L20 ANSWER 3 OF 22 ZCAPLUS COPYRIGHT 2003 ACS on STN
2003:568621 Document No. 139:118408 Halogenated aromatic compound,
(co)polymer thereof, and proton-conductive **membrane**
comprising same. Yamakawa, Yoshitaka; Takahashi, Masayuki; Goto,
Kohei (JSR Corporation, Japan). Eur. Pat. Appl. EP 1329444 A1
20030723, 33 pp. DESIGNATED STATES: R: AT, BE, CH, DE, DK, ES, FR,
GB, GR, IT, LI, LU, NL, SE, MC, PT, IE, SI, LT, LV, FI, RO, MK, CY,
AL, TR, BG, CZ, EE, HU, SK. (English). CODEN: EPXXDW.
APPLICATION: EP 2003-1191 20030121. PRIORITY: JP 2002-13450
20020122.

AB A halogenated arom. compd., a polyarylene (co)polymer obtained by
the polymn. of such a halogenated arom. compd. as a monomer
component, and a proton-conductive **membrane** made of a
sulfonation product of such a (co)polymer are disclosed. The
halogenated arom. compd. is represented by the following general
formula $R1X1A(X2BX3A)aX4B(X5B)bZ$ (A = electron-withdrawing group; B
= electron-donating atom or divalent group; X = halogenated
phenylene groups; Z = aryl group; a, b = 1-20). Thus, adding
2,5-dichloro-4'-[4-[4-(4-phenoxy)phenoxy]benzoyl]phenoxybenzophenone
12.3, [4,4'-dichlorobenzophenone 2,2-bis(4-hydroxyphenyl)-
1,1,1,3,3,3-hexafluoropropane] (Mn 12,200) 6.83,
bis(triphenylphosphine)nickel dichloride 0.589, NaI 0.507,
triphenylphosphine 2.73 and Zn 4.08 g to a flask, after purging with
N₂, combining with 54.6 mL N-methylpyrrolidone and heating with
stirring at 80.degree. for 3 h gave a polymer which was pptd. and
sulfonated to give a conductive polymer. The polymer was sol. in
N-methylpyrrolidone and THF and insol. in acetone, methanol, and
water. A solvent-cast film made from the sulfonated polymer had
good strength and resistance to hot water and Fenton's reagent.

L20 ANSWER 9 OF 22 ZCAPLUS COPYRIGHT 2003 ACS on STN

2003:299029 Document No. 138:305286 Manufacture of branched
polyarylene polymers with high toughness, their sulfonated products,
and proton-conducting **membranes**. Takahashi, Masayuki;
Yamakawa, Yoshitaka; Futami, Satoshi; Goto, Kohei (JSR Ltd., Japan).
Jpn. Kokai Tokkyo Koho JP 2003113226 A2 20030418, 21 pp.
(Japanese). CODEN: JKXXAF. APPLICATION: JP 2001-307430 200111003.

AB The branched polyarylene polymers are manufd. by copolymn. of (A)
monomers contg. XC6R4AC6R4X (X = Cl, Br, I; A = electron-withdrawing
group; R = H, F, alkyl, fluoroalkyl), XC6R4AC6R4OC6R4AC6R4X, and/or
X(C6R4AC6R4B)nC6R4AC6R4X (B = electron-donating group, divalent
group; n .gtoreq.2) and (B) monomers contg. X2C6R3A(C6R4B)mZ (Z =
aryl; m = 0, 1, 2), X-p-C6R4X, X-p-C6R4-p-C6R4X, and/or
1,3-X-disubstituted C6R4 in the presence of (C) branching agents
contg. C6R'5AC6R'5 (R' = H, Cl, Br, I, F, alkyl, fluoroalkyl,
.gtoreq.3 of R' = Cl, Br, I), C6R'5AC6R'4OC6R'4AC6R'5,
R'(C6R'4AC6R'4B)nC6R'4AC6R'5, C6R'6, and/or C6R'5C6R'5. The
proton-conducting **membranes**, useful for battery
electrolytes, etc., are prepd. by sulfonation of the branched
polyarylene polymers with sulfonating agents. Thus, polymn. of
2,5-dichloro-4-phenoxybenzophenone 178, 2,4,4'-trichlorobenzophenone
2.0, 4,4'-dichlorobenzophenone 16, and 4-chlorobenzophenone 4.0 mmol
gave a copolymer with Mw 146,000, which was sulfonated, dissolved in
1:1 vol NMP and methanol, cast, and dried to give a film with no
tackiness and good surface smoothness.

L20 ANSWER 16 OF 22 ZCAPLUS COPYRIGHT 2003 ACS on STN

2001:525113 Document No. 135:242639 Sulfonated poly(ether-ketone)s containing hexafluoroisopropylidene groups. Hamciuc, Corneliu; Bruma, Maria; Klapper, Marcus (Institute of Macromolecular Chemistry, Iasi, Rom.). Journal of Macromolecular Science, Pure and Applied Chemistry, A38(7), 659-671 (English) 2001. CODEN: JSPCE6. ISSN: 1060-1325. Publisher: Marcel Dekker, Inc..

AB An arom. poly(ether ketone) derived from 4,4'-(hexafluoroisopropylidene)diphenol and 4,4'-difluorobenzophenone has been sulfonated by using chlorosulfonic acid in 1,2-dichloroethane, in the presence of trimethylchlorosilane. The resulting modified polymers had different degrees of sulfonation depending on the reaction conditions. The sulfonation reaction with chlorosulfonic acid did not cause much degradn. of the initial polymer. The sulfonated polymers are sol. in various polar solvents such as N,N-dimethylacetamide, DMF, and pyridine (some in methanol), and could be cast into flexible tough films. The polymers were characterized by elemental analyses, IR and ^1H NMR spectroscopy, gel permeation chromatog., and thermogravimetric analyses. The degree of sulfonation was detd. by ^1H NMR spectroscopy. Some correlations between the conditions of sulfonation and the properties of the products have been made.

1997:595993 Document No. 127:296038 Development of solid electrolytes for water electrolysis at higher temperature. Linkous, Clovis A. (Florida Solar Energy Center, Cocoa, FL, 32922-5703, USA). Proceedings of the U.S. DOE Hydrogen Program Review, Miami, May 1-2, 1996, Volume 1, 443-448. National Renewable Energy Laboratory: Golden, Colo. (English) 1996. CODEN: 65ABAC.
- AB This report describes our efforts in developing new solid polymer electrolytes that will enable operation of proton exchange **membrane** electrolyzers at higher temps. than are currently possible. Several ionomers have been prepd. from polyetheretherketone (PEEK), polyethersulfone (PES), and polyphenylquinoxaline (PPQ) by employing various sulfonation procedures. By controlling the extent of sulfonation, a range of proton conductivities could be achieved, whose upper limit actually exceeded that of com. available perfluoralkyl sulfonates. Thermoconductimetric anal. of samples at various degrees of sulfonation showed an inverse relationship between cond. and max. operating temp. This was attributed to the dual effect of adding

sulfonate groups to the polymer: more acid groups produce more protons for increased cond., but they also increase water uptake, which mech. weakens the **membrane**. This situation was exacerbated by the limited acidity of the arom. sulfonic acids (pK_a .apprxeq. 2-3). The possibility of using partial fluorination to raise the acid dissocn. const. is discussed.

L21 ANSWER 6 OF 6 ZCAPLUS COPYRIGHT 2003 ACS on STN

1994:90539 Document No. 120:90539 Photoreactive fluorinated polyimide protected by tetrahydropyranyl (THP) group based on chemical amplification: acid generation in polyimide film and lithographic properties. Naitoh, Kazuhiko; Ishii, Kazuhisa; Yamaoka, Tsuguo; Omote, Toshihiko (Fac. Eng., Chiba Univ., Chiba, 263, Japan). Polymers for Advanced Technologies, 4(4), 294-301 (English) 1993. CODEN: PADTE5. ISSN: 1042-7147.

AB The photochem. of photoacid generator (PAG), diphenyliodonium 9,10-dimethoxyanthracene-2-sulfonate (DIAS) and diphenyliodonium 8-anilidonaphthalene-1-sulfonate (DIANS) was investigated in both alk.-sol. polyimide (6FDA-AHHFP) prep'd. from [trifluoro(trifluoromethyl)ethylidene]bis(isobenzofurandione) and bis(aminohydroxyphenyl)hexafluoropropane, and in novolak films. The quantum yields of photodisocn. of DIAS and DIANS in both 6FDA-AHHFP and novolak films were 0.11, 0.21, 0.12 and 0.26, resp. The quantum yields for acid generation from DIAS and DIANS in both of these films were 0.07, 0.18, 0.09 and 0.22, resp. The values of the quantum yields of photodisocn. and photoacid formation for DIAS and DIANS in 6FDA-AHHFP film are lower than those in novolak films. Fluorescence quenchings of sodium 9,10-dimethoxyanthracene-2-sulfonate and ammonium 8-anilidonaphthalene-1-sulfonate by a model comp'd. of polyimide was carried out in acetonitrile. The fluorescences of these two salts were efficiently quenched by the model comp'd. with the diffusion-controlled rate const. in acetonitrile, suggesting that a strong electron-accepting capability of the imide carbonyl group may hinder the electron transfer process within PAC mols. in 6FDA-AHHFP film. Although a polyimide (6F-THP) protected by tetrahydropyranyl group is insol. in aq. base, 6F-THP film contg. PAG became sol. in a 2:1 mixt. of 2.0 wt.% tetramethylammonium hydroxide (TMAH) and methanol by exposure to 365 nm light and successive post-exposure baking (PEB) at 120.degree. for 10 min. The sensitivity and contrast 6F-THP with DIANS after the PEB conditions above were 110 mJ/cm² and 3.7, resp. A high-resoln. pattern with a good profile was transferred into the 3 .mu.m thickness of the 6F-THP film.
